RE: Water testing done on Logan River

To Whom it May Concern,

Logan River is now less than 160 cfs. Because of the recent fluctuations, distribution has been virtually impossible. There has been some damage done because of the erratic flow in the river.

I have talked to personnel in the Logan Water Right's Office, and as Commissioner of Logan River, I am asking that as of June 8, 1992, no more testing be performed without your prior written request to do said testing, and the approval by the Commissioner for each and every test, until the end the irrigation season.

As I have asked previously, please consider the snowpack in the Logan River drainage area before consenting or contracting to water testing projects.

Logan River is probably lower earlier this year than in the last 15 years. Your cooperation would be greatly appreciated.

Sincerely,

Terry L. Gnehm
Logan River Water Commissioner
